How Bulls Have Been Handled:

1. **August** - Bulls were delivered to the test station, tagged, dewormed with Eprinex pour-on, treated with Probios and temperature recorded. The 14-day pre-test warm-up period began.
2. **September** - Bulls were weighed on-test and vaccinated with (*modified live* IBR, PI³, BVD, BRSV, 5-way Leptospirosis), (*Pasteurella haemolytica* and Multocida) and (7-way Blackleg - Clostridials) vaccines.
3. **October** - Yearling scrotal circumference measurements were taken on the senior bulls.
4. **December** - All bulls were weighed off-test weight and yearling scrotal circumference measurements were taken on the junior bulls.
5. **January** - Bulls were given complete Breeding Soundness Exam.
6. **Week Prior to Sale** - All bulls were weighed and measured.

Feed Program:

The bulls were fed a commodity by-product based test ration containing Rumensin during the 2-week pre-test warm-up period, the test and post-test periods. The GrowSafe 6000 system was used to measure individual intake data for each bull. The new system utilizes more of an individual feeding system, meaning that one bull eats at a time, but any bull in the pen can eat out of any feeding bunk/node within that pen. The bulls are tagged with an RFID tag upon arrival to the test. Each feeding node is equipped with a separate bunk, which sits on a set of load bars and is wrapped with an EID tag reader. When a bull puts his head through the bars and begins to eat, the node records his EID tag number, weight of the bunk, date, and time for every second he is eating at the bunk. Each node is hardwired to a data acquisition panel located within 30' of the feeding space. The data acquisition panel then wirelessly transmits the data back to the office computer for recording and data analysis. The system has certainly served in its role to calculate feed intake, but also has offered valuable information for test managers during the duration of the test. Data transmitted back to the computer is analyzed and presented on the computer in several different screens, but one of the most useful screens is the "reduced intake" screen. When a bull has a reduced intake meaning, decreased from the pen average or decreased 25% or more from his previous day's intake, his number shows up on this screen. Reduced intake information is used on a daily basis to help identify bulls that may have health concerns.

Residual feed intake is simply: actual feed intake - expected feed intake = residual feed intake. What does this number mean? A positive residual feed intake means the bull ate more feed than expected to achieve his actual performance, whereas a negative residual feed intake means the bull ate less feed than expected to achieve his actual performance. For example, if we have two bulls (start weights are the same) both gaining 2.5 lbs. per day over a 75-day period. We would expect them to eat approximately 1,500 lbs. of feed per bull over the test period. However, bull A ate 1,717 lbs. of feed and bull B ate 1,232 lbs. of feed. Bull A residual feed intake would be: 1,717 - 1,500 = 217 lbs., and bull B residual feed intake would be: 1,232 - 1,500 = -268. Overall, bull A ate 485 lbs. more feed over a 75-day test period to gain the same amount of weight as bull B. Therefore, in this scenario, bull B could be considered "more efficient" than bull A. Residual feed intakes are presented on one page in the back of the sale book. Please ask if you have any questions about the data or system.

Genetic Defects:

All Angus, Balancer, Red Angus and Simangus bulls are free of the Arthrogyrosis Multiplex (AM) and Neuropathic Hydrocephalus (NH) lethal genetic defects by pedigree or DNA test if there were potential carriers in their pedigrees.

Developmental Duplications Mutation (DD) - A genetic condition inherited as a simple recessive gene was reported recently (8/12/13).

The condition can be effectively managed by strategic DNA testing and avoidance of breeding carrier females to carrier sires.

Status of bulls in the sale will be denoted in the catalog below. DDF - indicates the animal is free of the mutation, DDC - indicates the animal is a carrier for the mutation, and DDP - indicates the animal is a potential carrier of the mutation.
